Reimagining the Mobile Experience: Leveraging Generative AI for Intelligent, Frictionless Product Innovation

Problem Statement

Modern mobile applications solve core user needs effectively, but most still rely heavily on manual user effort and static experiences.

Generative AI introduces the opportunity to build products that can:

1. Understand user intent and context
2. Personalise experiences dynamically
3. Reduce user effort and friction
4. Automate workflows intelligently
5. Improve engagement and retention at scale

Your task is to reimagine an existing mobile app using Generative AI. Identify meaningful user pain points, then design AI-driven features that improve user experience while also driving business impact.

Think about how Doraemon solves problems for Nobita, Shizuka, Gian, and Suneo through imaginative gadgets that simplify life. Your product thinking should aim for the same outcome.

Note:

The solution should focus only on Generative AI capabilities (LLMs, multimodal AI, AI agents, generation workflows, etc.) and not predictive AI or traditional machine learning systems.

Objective

Reimagine your favourite mobile app using Generative AI.

The goal is to rethink how existing products can become more intelligent, personalised, and effortless for users through GenAI-driven experiences.

Business Goal

Build a solution that creates measurable business impact by:

1. Increasing revenue or
2. Reducing operational costs

Expected Outcome

Build a working prototype (app/website) using AI-native tools such as:

- Lovable
- Bolt
- Cursor
- Replit
- v0
- Netlify
- Emergent
- Any similar platform

The prototype should demonstrate innovative GenAI features layered on top of an existing product experience, so the UI should look like the existing product itself.

Submission Structure

Submissions will consist of 2 parts.

Part 1 - Strategy Deck (6 Slides) (Tip: make using notebookLM, don't remove its watermark!)

Submit a concise 6-slide deck covering the following:

1. Problem Introduction + Impact + User Breakdown

- Clearly define the problem
- Explain business/user impact
- Mention assumptions or hypotheses, if any

2. Why GenAI?

- Why is Generative AI the right solution for this problem?
- Why are traditional approaches insufficient?

3. User Segments + Solution Overview

- Target users
- Core insight
- High-level solution

4. Solution Deep Dive

- User flows
- Product experience
- AI interaction layer
- Key workflows/features

5. Success Metrics

Examples:

- Retention uplift
- Conversion increase
- Time saved
- Engagement growth
- Cost reduction

6. Pitfalls + Workarounds

Address possible concerns such as:

- Hallucinations
- Privacy
- Latency
- User trust
- Scalability
- Adoption barriers

Only PDF submissions will be accepted.

Part 2 - Prototype Submission

Submit a published prototype URL.

Accepted platforms include:

- Lovable
- Bolt
- Netlify
- Replit
- Vercel
- Emergent
- Similar hosting/build platforms

Evaluation Parameters

Projects will be evaluated on:

- Problem clarity and depth
- Suitability of GenAI usage
- Quality of solutioning
- Uniqueness and originality
- Business impact potential
- Deck flow and storytelling
- Exhaustiveness of solution design
- Prototype functionality
- Prototype visual appeal
